

## Assignment 7; Due Friday, November 11

Read section nine on connected spaces, and the beginning of section ten on pancake problems. Then do the following problems:

- 9.8 abd
- 9.8 ef (graduate students only)
- 9.8 h
- 9.8 i (graduate students only)
- 10.7 a
- Let  $p \in X$ . Prove that the union of all connected subsets of  $X$  containing  $p$  is itself connected. This union is thus the *largest* connected subset of  $X$  containing  $p$ . It is called the *connected component* of  $p$ .
- If  $p, q \in X$ , prove that the connected component of  $p$  and the connected component of  $q$  are either equal or else disjoint. Conclude that  $X$  can be written uniquely as a disjoint union of connected components.
- What are the connected components of  $\{(x, y) \in \mathbb{R}^2 \mid y \neq 0\}$ ? What are the connected components of  $Q$ ?
- (graduate students only) Show that each connected component is closed. Show by example that connected components may or may not be open.
- (graduate students only) Let  $O(n)$  be the set of all linear transformations

$$A : \mathbb{R}^n \rightarrow \mathbb{R}^n$$

which preserve distance, so  $\|Av\| = \|v\|$ . This set is a group, the *orthogonal group*.

Denote the standard dot product on  $\mathbb{R}^n$  by  $\langle v, w \rangle$ . Prove that  $\|v+w\|^2 - \|v\|^2 - \|w\|^2 = 2\langle v, w \rangle$ . Conclude that a linear transformation  $A$  is in  $O(n)$  if and only if  $\langle Av, Aw \rangle = \langle v, w \rangle$  for all vectors  $v$  and  $w$ . Using this result, prove that a matrix  $A$  represents an element of  $O(n)$  if and only if  $A^t A = I$ .

Give  $O(n)$  a topology by noticing that each  $n \times n$  matrix has  $n^2$  components, so  $O(n) \subseteq \mathbb{R}^{n^2}$ . Prove that  $O(n)$  is compact.

Find the connected components of  $O(n)$ . I'll give two hints:

Suppose  $A \subseteq X$  and suppose that whenever  $p$  and  $q$  are points in  $A$ , there is a continuous map  $\gamma : [0, 1] \rightarrow A$  such that  $\gamma(0) = p$  and  $\gamma(1) = q$ . Then  $A$  is connected. This result is easy to prove.

You may use without proof the following result from linear algebra: If  $A \in O(n)$ , there exist matrices  $B$  and  $C$  in  $O(n)$  such that  $A = BCB^{-1}$  where  $C$  has  $1 \times 1$  and  $2 \times 2$  blocks on the diagonal and is otherwise zero, and the  $1 \times 1$  blocks are  $(\pm 1)$  and the  $2 \times 2$  blocks are

$$\begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$
